Submitted by Steven G. Krantz

Keywords:

Sums of products

Extended q -Euler numbers and polynomialsHigher-order extended q -Euler numbers and polynomialsAlternating Hurwitz q -zeta functionsAlternating multiple Hurwitz q -zeta functions q -Stirling numbers of the first kind

The following sentences need to be added in the introduction part of [9]: “The function $\zeta_{E,q}^{(n)}(s, x)$ was defined by T. Kim [4,7] in order to derive many new identities involving q -Euler numbers and polynomials of higher order, the analytic continuation into the entire complex s -plane. The properties for the related multiple q -zeta and multiple q - L -functions have also been studied in detail by him in [1–8].”

We are grateful to Professor Taekyun Kim for notifying about this.
